Abstract

When writing a large manuscript, it is sometimes beneficial to repeat a theorem (or lemma or . . .) at an earlier or later point for didactical purposes. However, thmtools's built-in `restatable` only allows replicating theorems *after* they have been stated, and only in the same document. reptheorem solves the issue by making use of the `.aux` file, and also introduces its own file extension, `.thm`, to replicate theorems in other files.

Contents

1 Repeating theorems

Let's say we define a theorem as follows:

```
\begin{theorem}[Yoneda Lemma]
    For \(F\colon \mathcal{C}\to \mathbf{Set}\) a functor,
    \([\mathcal{C}^\mathrm{op},\mathbf{Set}](YA, F) \cong F(A)\)%
    for all objects \(A\) in \(\mathcal{C}\).
\end{theorem}
```

Its output is of course

Theorem 1 (Yoneda Lemma)**.** *For $F\colon \mathcal{C} \to \mathbf{Set}$ a functor, $[\mathcal{C}^{\mathrm{op}}, \mathbf{Set}](YA, F) \cong F(A)$ for all objects A in $\mathcal{C}$.*

`makethm` (*env.*)

Now let's say we want to replicate the theorem within the same document. That is what the new environment `makethm` is used for.

```
\begin{makethm}{theorem}{thm:Yoneda}[Yoneda Lemma]
    For \(F\colon \mathcal{C}\to \mathbf{Set}\) a functor,
```

*Version v1.1, last revised 2024-08-12.

```
    \([\mathcal{C}^\mathrm{op},\mathbf{Set}](YA, F) \cong F(A)\)
    for all objects \(A\) in \(\mathcal{C}\).
\end{makethm}
```

Its output is the same (in fact, we've secretly used `makethm` in the previous example), but the important difference is that we have saved the theorem for later use.

The `makethm` environment takes two mandatory arguments and one optional one. The first mandatory argument is the type of theorem environment, like `theorem`, `lemma`, `definition`, etc. The second is the theorem's label. The label is mandatory because to replicate the theorem, we need to have a "name" attached to it. `makethm` automatically attaches a `\label`, as well, so `\ref{thm:Yoneda}` becomes 1. The optional argument is passed right to the optional argument of the theorem environment, giving the name of a theorem

Now let's say we want to replicate the theorem later or earlier in the text. This may be done if, for example, the theorem is proven at a later point, or we want to "tease" the reader with a powerful theorem that will be proven later in the chapter. To do this, we use the command, as follows.

`repthm`

```
\repthm{theorem}{thm:Yoneda}
```

This outputs the theorem again.

Theorem ??.

thm:Yoneda The label of this theorem is a `\ref`, and automatically links to the original theorem statement.

If the original theorem statement exists in a different file, or has not been created yet, we can add a placeholder alt text to the `\repthm` as an optional argument, which only displays if the theorem is undefined. For example, `\repthm{theorem}{thm:foo}[bar]` returns

Theorem ??.

thm:foo[bar] If we do the same without providing an alt text, we get

Theorem ??.

thm:foo together with a warning.

Since we're using the `.aux` file, it is possible to replicate a theorem before it is stated. For example,

```
\repthm{theorem}{thm:later}
\begin{makethm}{theorem}{thm:later}[Later]
    Alligator!
\end{makethm}
```

returns

Theorem ??.

thm:later

Theorem 2 (Later)**.** *Alligator*

Note that it is necessary to run a `.tex` file twice to replicate theorems ahead of time, similarly to how one has to run a file twice to make sure the references are correct.

2 Replicating theorems between files

Let's say we have the following files for our project:

```
foo.tex
bar.tex
```

Let's say that we have defined a theorem `thm:baz` in `bar.tex`, and we want to
`\theoremfile` replicate it in `foo.tex`. To achieve this, we first use the `\theoremfile` command in the preamble of `bar.tex`. This compiles all theorems defined in `bar.tex` and outputs them into a file `bar.thm`. To then import these into `foo.tex`, we use
`\loadtheorems` `\loadtheorems{bar.thm}` in the preamble, which loads all theorems saved in `bar.thm`. One can then use `\repthm` as usual.

Since the `.aux` file is loaded at `\begin{document}`, putting `\loadtheorems` in the preamble of a file will guarantee that the loaded theorem file will be overwritten by the theorems in the `.aux` file, i.e., theorems defined in the same document. In our example, if we also defined a `thm:baz` in `foo.tex`, loading `bar.thm` into `foo.tex` will not overwrite the local `thm:baz`.

2.1 Replicating theorems to subfiles

Replicating theorems to different files is particularly useful when working in big documents with multiple subfiles. For example, let's say we have the files

```
main.tex
foo.tex
bar.tex
```

Here, `main.tex` is generated by including `foo.tex` and `bar.tex` as chapters, creating a single large document. It is now possible to replicate theorems within the subfiles by running `\theoremfile` in `main.tex`, and then using `\loadtheorems{main.thm}` in `foo.tex` and `bar.tex`. This will allow us to use all theorems in the final `main.tex` in each of the subfiles.

3 Source code

```
1 ⟨*package⟩
2 \ProvidesPackage{reptheorem}[2024-08-12 v1.1 Reptheorem package]
```

`\theoremfile` Using `\theoremfile` will output all saved theorems into an output file. By default, if your LaTeXfile is `foo.tex`, the output file is `foo.thm`.

```
3 \def\reptheorem@theoremfile{\relax}
4 \NewDocumentCommand{\theoremfile}{ O{\jobname.thm} }{
5  % O: the path of the file to which we should save theorems
```

```
 %
  \def\reptheorem@theoremfile{#1}
 \newwrite\@thmlist
 \immediate\openout\@thmlist=#1
}
```

`\loadtheorems` If you have exported saved theorems to a file, you can load them into another file using the macro `\loadtheorems`.

```
\NewDocumentCommand{\loadtheorems}{ m }{
 \IfFileExists{#1}{
  \input{#1}
 }{
  \PackageWarning{reptheorem}{%
   File #1 not found. I will not import any theorems.%
  }
 }
}
```

`makethm` (*env.*) On to defining the actual theorems to be saved.

```
\NewDocumentEnvironment{makethm}{ m m o +b }
 % m: the type of theorem environment
 % m: the name of the theorem
 % o: optional parameter for environment
 % b: the content of the theorem
 %
 {%
  \IfValueTF{#3}{% Check if theorem has optional arguments
   \begin{#1}[#3]\label{#2}
  }{
   \begin{#1}\label{#2}
  }
  #4
  \end{#1}
  \expandafter\gdef\csname thmtype@#2\endcsname{#1}
  \expandafter\long\expandafter\gdef\csname thm@#2\endcsname{#4}%
  \expandafter\gdef\csname thmdesc@#2\endcsname{#3}%
  % Saving parameters to aux file
  \long\gdef\@thmoutput{%
   \string\expandafter\string\gdef\noexpand%
   \csname thmtype@#2\string\endcsname{#1}%
   ^^J%
   \string\expandafter\string\long\string\expandafter%
   \string\gdef\noexpand\csname thm@#2\string\endcsname{#4}%
   ^^J%
   \string\expandafter\string\gdef\noexpand%
   \csname thmdesc@#2\string\endcsname{#3}%
  }
  \write\@auxout{\@thmoutput}
  \if\reptheorem@theoremfile\relax
   % No file has been set
  \else
   % We have a theorem file
   % Saving parameters to theorem file
   \write\@thmlist{\@thmoutput}
```

```
  \fi
 }{}
```

\repthm To repeat a theorem, use the \repthm command. The type of theorem is not saved, so it is necessary to respecify it each time a theorem is repeated.

```
\newcounter{old@counter}
\NewDocumentCommand{\repthm}{ m +o }{
 % m: the name of the theorem
 % o: alt text
 \begingroup
  % Check if thmtype is given
  \ifcsname thmtype@#1\endcsname%
   \expandafter\let\expandafter\@@thmtype\csname thmtype@#1\endcsname%
  \else%
   \def\@@thmtype{theorem}%
  \fi%
  %
  % Save theorem counter so we don't increase it
  \setcounter{old@counter}{\value{\@@thmtype}}
        \def\thetheorem{\ref{#1}}
  \let\@@theoremnotdefined\relax
  %
  \ifcsname thm@#1\endcsname% Check if theorem is even defined
   % Theorem is defined
   \expandafter\edef\expandafter\@@thmdesc{\csname thmdesc@#1\endcsname}%
   \expandafter\let\expandafter\@@thm\csname thm@#1\endcsname
   % Output theorem
   \IfValueTF{\@@thmdesc}{% Check if theorem has name
    \begin{\@@thmtype}[\@@thmdesc]
     \@@thm
    \end{\@@thmtype}
   }{% No optionals
    \begin{\@@thmtype}
     \@@thm
    \end{\@@thmtype}
   }
  \else
   % Theorem undefined
   \IfValueTF{#2}{
    \begin{\@@thmtype}
     #2
    \end{\@@thmtype}
   }{% No theorem or alt text provided: throw warning
    \begin{\@@thmtype}
    \end{\@@thmtype}
    \PackageWarning{reptheorem}{%
     Theorem #1 not defined; rebuild your project.
     If the issue persists, create the theorem using
     \begin{makethm} or consider adding alt text to \repthm
     using the optional parameter%
    }
   }
  \fi
  \setcounter{\@@thmtype}{\value{old@counter}}
```

```
106   % Reset theorem counter back to original
107     \endgroup
108 }
```
